Float and Clear in CSS

1. Float in CSS

The float property in CSS is used to position elements to the left or right, allowing other elements to wrap around them.

Syntax:

```
.element {
    float: left; /* or right */
}
```

Values of Float:

- **left** → Aligns the element to the left, and other content wraps around it.
- **right** → Aligns the element to the right, and other content wraps around it.
- **none** → Default value; the element does not float.
- **inherit** → Inherits the float value from its parent.

2. Clear in CSS

The clear property is used to prevent elements from wrapping around floated elements.

Syntax:

```
.element {
    clear: left; /* or right, both */
}
```

Values of Clear:

- **left** → Clears content from floating elements on the left.
- **right** → Clears content from floating elements on the right.
- **both** → Clears both left and right floated elements.
- **none** → Default value; does not clear floats.
